Recording muscle receptor tyrosine kinase(s) - and pull-standard process. Transformed cells, polypeptide(s) and antibodies, related vectors, transformed cells, polypeptide(s) and antibodies, related vectors, transformed cells, polypeptide(s) and antibodies.

The tyrosine kinase region (R94990) and other polypeptide portions the tyrosine kinase region (R94990) and other polypeptide portions the tyrosine kinase region (R94990) and other polypeptide portions the tyrosine for Nsk2 in growth and differentiation, in used to study the role of Nsk2 in growth and differentiation, in the development of Nsk (ant)agonists, to identify other components the development of Nsk (ant)agonists, to identify other components tumours and muscular dystrophy. Nsk2 is a novel member of a new terminally differentiated skeletal myotubes in vitro and in adult cerminally differentiated skeletal myotubes in vitro and in adult considered the skeletal myotubes in vitro and in adult considered the skeletal myotubes in vitro and in adult considered the skeletal myotubes in vitro and in adult considered the skeletal myotubes in vitro and in adult considered the skeletal myotubes in vitro and in adult considered the skeletal myotubes in vitro and in adult considered the skeletal myotubes in vitro and in adult considered the skeletal myotubes in vitro and in adult considered the skeletal myotubes in vitro and in adult considered the skeletal myotubes in vitro and in adult considered the skeletal myotubes in vitro and in adult considered the skeletal myotubes in vitro and in adult considered the skeletal myotubes in vitro and in adult considered the skeletal myotubes in vitro and in adult considered the skeletal myotubes in vitro and in adult considered the skeletal myotubes in vitro and in adult considered the skeletal myotubes in vitro and in the skeletal myotubes in vitro a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     W09611664-A2.

The vector and host cells can be used for cerebral implantation to where KAT can directly catalyse the production of kynurenic acid (KYNA) from kynurenine (KNN). It is thought KYNA acts function. KYNA concentrations and the activity of KAT show an increase with age. KAT inhibitors, by providing an increase of the glutamatergic tone at the NNDA receptor, could be useful in situations where NNDA receptor function is insufficient and/or KAT solventity and KYNA levels are abnormally enhanced. Hence they could consequences associated with the aging processes in the brain. Sequence 423 AA;

Claim 16; Figure 3; 51pp; English.

C Sequences encoding Kynnrenine aminotransferase (KAT) can be inserted into vectors and subsequently cells and hence can be used for gene therapy. The vector and host cells can be used for cerebral implantation to where KAT can directly catalyse the production of Kynurenic acid (KYNA) from kynurenine (KYN). It is thought KYNA acts in regative endogenous modulator of cerebral glutamatergic function. KYNA concentrations and the activity of KAT show an increase with age. KAT inhibitors, by providing an increase of the concentrations where the NMDA receptor, could be useful in situations where NMDA receptor function is insufficient and/or KAT consequences associated with the treatment of the pathological consequences associated with the agine processes in the brain.

C Struct Structurally useful in the treatment of the pathological consequences associated with the agine processes in the brain.

Sequences encoding Kynurenine antinotransferase (KAT) can be inserted Sequences encoding Kynurenine antinotransferase (KAT) can be used for gene can be cectors and subsequently cells and hence can be used for gene therapy. The vector and host cells can be used for cerebral implantation to where KAT can directly catalyse the production of implantation to where KAT can directly catalyse the production of as a negative endogenous modulator of cerebral glutamatergic can concentrations and the activity of KAT show an increase with age. KAT inhibitors by providing an increase of the confirmatergic tone at the NMDA receptor, could be useful in contact tone at the NMDA receptor, could be useful in cataly where NMDA receptor function is insufficient and/or KAT consequences associated with the aping processes in the brain. Consequences associated with the aging processes in the brain. Consequences associated with the aging processes in the brain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Chimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       transforming growth factor alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ۳
        specific cell (4-65; 106pp; English. Claim 7; Page 64-65; 106pp; English. A multidommain protein (R99054) has a FLAG epitope, a portion A multidommain protein (R99054) has a FLAG epitope, a portion of human transforming growth factor-alpha (FGG-a) that acts as a of human transforming growth factorin of Pseudomonas acruginosa ligand domain, a non-cytotoxic portion of Pseudomonas acruginosa extoxin A acting as a translocation domain and the DNA exotoxin A acting as a translocation domain and the DNA exotoxin A acting as a translocation domain and the growth of a fusion binding domain of a can be expressed in E. coli (resulting in gene (729410) and can be expressed in E. coli (resulting in removal of an ompa signal peptide). It is used with an effector nucleic acid that comprises e.g. a gene to be delivered to a cell and a cognate structure for the GAL4 DNA binding domain. This provides a novel means of nucleic acid transfer, suitable for the to-rany.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            9-AUG-1996 (first entry)

specific cell "Characteria commain to target nucleic acid to Claim 7; Page 67-69; 106pp; English.

A multidomain protein (R95055) has a FLAG epitope, a portion of human interleukin-2 that acts as a ligand domain, a non-cytotoxic portion of pseudomonas aeruginosa exotoxin A acting as a translocation domain and the DNA binding domain of yeast GAL4. It is the product of a fusion gene (T29411) and can be expressed in E. coli (resulting in removal of an ompA signal peptide). It is used with an effector nucleic acid that comprises e.g. a gene to be delivered to a cell and a cognate structure for the GAL4 DNA binding domain. This provides a novel means of nucleic acid transfer.
                                                                                                                          NU-PSDB; T29411.

G-protein coupled receptor protein DNA and protein - also methods in solating (ant) agonists for treatment of cystic fibrosis, licontinence and diabetes claim 6; page 267-68; 360pp; English.

A novel human placenta-derived G-protein coupled receptor protein phate-17 (T16368). The protein can be obtd, by expression of the purinceptor in transformed host cells. It was classified as a used to screen agonists and antagonists that modulate G-pcRp sequence 328 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   of the nitrilase gene in SK92 chromosomal DNA. Introduction of a plasmid carrying the regulatory gene plus the nitrilase gene and its promoter allows efficient prodm. of nitrilase by a Rhodococus sptransformant. The nitrilase is useful for the commercial prodm. of organic acids and amides from nitriles. Sequence 244 AA;

Example 6: Fig 11: 83pp English.

Partial cDNA clone pBrhTx-1(b)1 (T32444) codes for a portion
Partial cDNA in the samplification of wasp cDNA in
BrhTx-1. It was obtd. by FCR amplification of wasp cDNA in
BrhTx-1. It was obtd. by FCR amplification of a plaque-purified
a phage clone. Primers BH(b) and BH(b)D (T32445-46) based on the clone
were used to re-screen the library beading to the isolation of clone
BrhTx-1(b) (T32429) that coded for the toxin (b) subunit (R99577).

This can be utilised in breeding of biological control agents used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        51

            The present sequence is the C. pneumoniae polypeptide antigen, polypeptide A. C. pneumoniae strain YK41 was cultured and genomic blaw extracted to prep. a lambda gt11 DNA library. The library was was prepd. by fusing spleen cells from a mouse infected with an anti-YK41 monoclonal antibody (MAb), which was prepd. by fusing spleen cells from a mouse infected with YK41 was both did was then fused with the expression vector pADA431 to produce a MAb expressing hydridoma. If the DNA obth was then fused with the expression vector pADA431 to host, which was cultured to give the antigenic polypeptide. The blasmid was used to transform an E coli polypeptide A. Polypeptide A and primers and probes derived from antibodies and DNA, respectively, useful in the diagnosis of semicona antibodies infection.
                                                                                                                                                                                                                                                                                                                                                                                    diagnosis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA encoding SacI restriction endonuclease and methylase - useful for prodn. of the enzyme.

Claim 3; Column 15-18; 16pp; English.

This sequence represents the SacI endonuclease from Streptomyces achromogenes. W00623 represents the SacI methylase. The DNA encoding sachromogenes, and amplified using the primers shown in T35806-T35811. The amplified sequences were then cloned into the plasmid pLG339 which was used to modify an E.coli host cell. The host cell can then be used Sequence 358 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 51
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Length: 358 February 11, 2000 15:48 Type: P

CC The present sequence is the C. pneumoniae strain YK41 was

CC polypeptide A clone, 53-3S. C. pneumoniae strain YK41 was

CC cultured and genomic DNA extracted to prep. a lambda gtil DNA

CC library. The library was then screened with an anti-YK41

CC monoclonal antibody (MAD), which was preped. by fusing spleen cells

CC from a mouse infected with YK41 with myeloma By/NS1/-B44-1 to

CC produce a MAD expressing hydridoma. The DNA obtd. was then fused

CC with the expression vector pADA431 to give pcPN533alpha. The

CC plasmid was used to transform an E. coli host, which was cultured

CC to give the antigenic polypeptide, polypeptide A. Polypeptide A

CC and primers and probes derived from its DNA can be used in assays

CC for the detection of polypeptide A antibodies and DNA,

CC respectively, useful in the diagnosis of C. pneumoniae infection.
                                                                                                                                                                                                                                                                                                                                                                                                       PRESENTATION

The variant cDNA sequence (see T35310) lacks a sequence of two nucleotides, AG, corresponding to positions 1868 and 1869 of the wild-type sequence (see T35306). A fragment complemetary to the sequence from nucleotides 537-653 is used as a probe to detect a chromosome 12pl3 abnormality associated with neoplastic disease, in partic, acute lymphoblastic leukaemia. The probe hybridises to a part of the region coding for the two tandem SH2 domains (see R9312).

If the probe will not hybridise DNA of chromosome 12pl3 from a patient sample it is indicative of an abnormality, normally associated with neoplastic, Alternatively the wild-type SH-PFP1 or SH-PFP2 gene or protein may be used for comparison to sequenced PFP genes taken from a patient, where differences indicate an abnormality. The activity of SH-PFP1 may also be purposely altered by mutation to effect a change in megakaryocyte function and hence platelet production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             R99316 Length: 458

CC This sequence represents the thyroid transcription factor, TTF-1. The CT TF-1 DNA sequence was isolated from the human adenocarcinoma cell line CC H441. The TTF-1 locus is contained within a 4.6 kb BamHI fragment and CC consists of two exons and one intron. This predicted amino acid CC sequence of human TTF-1 shows close identity with the amino acid CC sequence predicted by the rat TTF-1 cDNA sequence and 92.4% identity CC with the rat TTF-1 cDNA. The intron is approx. I kb in length and CC is flanked by consensus splice donor-acceptor sites that fit splice CC acceptor-donor rules. The mRNA produced is 2.3 kb as detected by CC adenocarcinoma cells. TTF-1 mRNA was detected in human pulmonary CC adenocarcinoma cells. TTF-1 mRNA was detected in human pulmonary CC adenocarcinoma cells. TTF-1 mRNA was detected in human pulmonary CC adenocarcinoma cells. TTF-1 has been detected in nuclei of the respiratory epithelian to the for pro-SP-C. TTF-1 was detected in subsets of conscillated bronchiolar, and rarely in noncillated bronchiolar respiratory epithelial cells in the developing lung, including calveolar Type II epithelial cells. TTF-1 was not detected in subsets of alveolar Type II epithelial cells. The detected in the adult lung, and was most prominent in type II epithelial cells but was excluded from type I cells. Or cillated bronchiolar epithelial cells. The adult lung, and was most prominent in type II epithelial cells but was excluded from the tells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             R83015

       Human Cytoplasmic antiproteinase-2 (CAP-2) and CAP-3 - serine protease inhibitors useful in the purification of proteins and in the treatment of inflammatory diseases and apoptosis. Claim 9: Page 37-38: 50pp: English.

Human cytoplasmic antiproteinase-2 protein (CAP-2) (R99253) is an inhibitor of specific trypsin-like serine proteases. Its amino acid sequence was deduced from a CDNA clone (T35220) isolated from a human placenta lambda gtil cDNA library. Another serpin, CAP-3 (R99254), has also been identified. The CAPs are useful for the purification of proteins and in the treatment of inflammatory diseases and apoptosis. They can be expressed in transformed or 171 and 
   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                N-PSDB; T35220
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             02-FEB-1996; U01288

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               SEQUENCE 1.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               101
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human vascular endothelial growth factor (VEGF)-like polypeptide (W00725) is capable inducing the proliferation of vascular endothelial cells, of interacting with fit-l/fkl-1 receptors, and of inducing cell migration, cell survival and/or an increase in intracellular levels of alkaline phosphatase. It shows 33.3% identity with human VEGF (see also W00724). Splice variants (W00725-28) of SOM175 have also been identified. Recombinant SOM175 can be produced in host cells transformed with vectors carrying SOM175 could see also T33610). It is useful for inducing astroglial proliferation and for promoting neural survival and/or proliferation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             proliferation and secuence 207 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detection and determination of anti-Chlamydia pneumoniae antibody using the polypeptide C as the antigen Example 3; Page 17-18; 18pp; Japannese. The protein is that of the Chlamydia pneumoniae 53 kDa antigen. A method for the detection and determination of anti-C. pneumoniae antibodies in a sample comprises using at least 5 consecutive amino acids of the polypeptide C 73 kDa antigen (W01742). vascular endothelial growth factor VEGF-B proteins - useful to vascular endothelial growth factor VEGF-B proteins - useful to accelerate angiogenesis in wound healing, also related nucleic acid accelerate angiogenesis in wound healing, also related nucleic acid and intibodies for cancer diagnosts.

Claim 18; Page 62; 107pp; English.

Claim 18; Page 62; 107pp; English.

WO4824-W04831 represent the vascular endothelial growth factor (VEGF) proteins of the invention, which promote endothelial or mesodermal cell proteins of the invention, which promote endothelial or mesodermal cell proteins of the invention, which promote endothelial or mesodermal cell proteins of the invention, which promote endothelial or mesodermal cell proteins of the invention, which promote endothelial or mesodermal cell proteins of the invention, which promote endothelial or mesodermal cell proteins of the invention, which promote endothelial or mesodermal cell proteins of the invention, which promote endothelial or mesodermal cell proteins of the invention, which promote endothelial or mesodermal cell proteins of the invention, which promote endothelial or mesodermal cell proteins of the invention, which promote endothelial or mesodermal cell proteins of the invention, which promote endothelial or mesodermal cell proteins.

VESF is a potent endothelial cell mitogen, and directly contributes to induction of anglogenesis in vivo by promoting endothelial cell growth during normal embryonic development, wound healing, and cell growth during normal embryonic development, wound healing, and contistue regeneration/reorganisation. The VESF proteins of the invention can development to the proteins can therefore can dexpressed in tissues differently to VESF. The proteins can therefore can dexpressed in tissues differently to VESF. The proteins can therefore the proteins can be used for inhibiting angiogenesis. The antibodies against the proteins can be used diagnostically to quantitatively detect VESF-B. Primers can be used to detect VESF-B ording sequences for the proteins of the invention complementary to the odding sequences for the proteins of the invention of complementary to the odding sequences of the invention of complementary to the odding sequences. Quantification of complementary to the odding sequences of the invention of can also be used to detect VESF-B coding sequences. Quantification of complementary to the odding sequences of the invention of complementary to the odding sequences. Quantification of can also be used to detect VESF-B expression in a cell can be retarded using contistence sequences direct against the VESF codding sequences, this is sequence 207 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            W04831

Claim 19: Page 91-92; 124pp; English.

Dirofilaria immitis mature venom allergen antigen 5-like protein va5 (W11481), or PDIVA205, is capable of eliciting an immune response (cellular and/or humoral) in animals. It is encoded by a response (cellular and/or humoral) in animals. It is encoded by a CDNA molecule nDIVA615 (751379). VA5-like proteins (see also CDNA molecule nDIVA615 (751379).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       201

microorganism producing nitrilase in absence of inducer - useful as reatalyst in large scale organic acid production

claim 7; Pages 7-8; 13pp; Japanese.

The present sequence is one of the two components of the resent sequence is one of the two components of the resent sequence is one of the two components of the reconstanting the resent sequence are regulatory factor (RF), which containing the RF gene can be used to transform a microorganism, or containing the RF gene can be used to transform a microorganism, or can builting it to produce nitrilase in pright yield without adding any conductor to the medium. Hence, the preparation of the medium is easy confidered to the rest culture of the microorganism, and the cidsposal cost of the waste culture is reduced. Nutrilase is caids, as it hydrolyses nitriles into their corresponding acids.

CC The present sequence is encoded by a putative open reading frame (ORF) of CC putative ORFs with different polarities. It is hypothesised that some of CC putative ORFs with motification polarities with homology to the ptl genes of Bordetella pertussis and VIR B4 genes of Agrobacterium tumefactens and CC Salmonella genus. The absence of the CagA gene in the type I strains is factors restricted to type I strains). The CagI nucleotide sequence, its fargments and encoded proteins are used in the diagnosis of H. pylori type I strain) infection in an individual and in vaccines duodenal and gastric ulcers, severe forms of active gastriitis (esp. type Sequence 140 AA;
                                                                                                                                                                                                                                                        W06943

pr Helicobacter pylori CagI polynucleotide and related proteins - used pri in diagnosis and in vaccines for the treatment of H. pylori pri in diagnosis and in vaccines for the treatment of H. pylori pri indiagnosis and in vaccines for the treatment of H. pylori pri indiagnosis and in vaccines for the CagI region contains clusters of Sisclosure; Fig 4D; 303pp; English.

Provided the CagI locus (see T46159). The CagI region contains clusters of the CagI locus (see T46159). The CagI region contains clusters of CC putative ONFS with different polarities. It is hypothesised that some of CC putative ONFS with different polarities. It is hypothesised that some of CC putative ONFS with motifs shared by the purported invasion factors of CC associated with the absence of the CagA gene in the type I strains is Salmonella genus. The absence of CagI sequences (which may encode virulence associated with the absence of CagI sequences (which may encode virulence CC (esp. H. pylori type I strains). The CagI nucleotide sequence, its fragments and encoded proteins are used in the diagnosis of H. pylori cycle I strains) infection in an individual and in vaccines (esp. H. pylori type I strain) infection in factive gastritis (esp. type CC daudeinal and gastric ulcers, severe forms of active gastritis (esp. type CC castritis) and dastric adenocarcinoma.

In Helicobacter pylori nucleic acid sequences and related prolypeptide(s) useful for vaccines to treat or prevent H. pylori prolypeptide(s) useful for vaccines to treat or prevent H. pylori prolypeptide pylori nifection, and to detect Helicobacter for claim 72; Page 1289; 1481.pp; English.

CC Infaction or to 1289; 1481.pp; English.

CC Infection or to identify H. pylori secreted or periplasmic protein.

CC useful as potential H. pylori polypeptide binding compounds.

CC useful as potential H. pylori | NTCC 5579) was determined from crown or to proper analysed for ORT of at least 180 nucleotides.

CC DNA. The sequences were analysed for ORT of at least 180 nucleotides.

CC and the predicted coding regions defined by computer evaluation. To compute development, the amino crown of the pylori antigens for vaccine development, the amino crown sequences predicted from various ORT were analysed for significant acid sequences predicted from various ORT were analysed for significant conditions the sequences of interest, particular regions can be solared from H. pylori by PCR amplification for recombinant polypeptide correduction, e.g. in E. coli hosts.

PT Helicobacter pylori nucleic acid sequences and related problypeptide(s) - useful for vaccines to treat or prevent H. pylori PT infection, and to detect Helicobacter Claim 72; Page 463; 1481pp; English.

CC This sequence is a H. pylori secreted or periplasmic protein may be used in a vaccine to prevent or treat H. pylori CC infection or to identify H. pylori polypeptide binding compounds, curve the protein may be used in a vaccine to prevent or treat H. pylori CC useful as potential H. pylori life cycle activators or inhibitors.

CC overlapping contigs generated by mechanically shearing the bacterial CC useful as potenties were analysed for ORF of at least 180 nucleotides, created the predicted coding regions defined by computer evaluation. To CC and the predicted coding regions defined by computer evaluation. To CC identify likely H. pylori antigens for vaccine development, the amino CC considered protected from various ORF were analysed for significant CC and determined the sequences of interest, particular regions can be considered from H. pylori by PCR amplification for recombinant polypeptide cc isolated from H. pylori by PCR amplification for recombinant polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PT Helicobacter Pylori nucleic acid sequences and related PT polypeptide(s) - useful for vaccines to treat or prevent H. pylori PT infection, and to detect Helicobacter Science Science Science 1187; 1481pp; English.

CC This sequence represents a H. pylori flagella-associated protein. CC The protein may be used in a vaccine to prevent or treat H. pylori CC Useful as potential H. pylori polypeptide binding compounds, the genomic sequence of H. pylori (ATCC 5579) was determined from CC Owal as potential H. pylori (ATCC 5579) was determined from CC DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To contify likely H. pylori antigens defined by computer evaluation. To acid sequences predicted from various ORF were analysed for significant and determined the sequences of interest, particular regions can be production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                                                                             06-JUN-1996; U0912:

PT Helicobacter Pylori nucleic acid sequences and related PT polypeptide(s) - useful for vaccines to treat or prevent H. pylori PT infection, and to detect Helicobacter PS claim 56; Pages 516; 1481pp; English.

CC The present sequence is a Helicobacter pylori cell envelope protein. CC The present sequence is a Helicobacter pylori cell envelope protein. CC infection or to identify H. pylori polypeptide binding compounds, useful cas potential H. pylori life cycle activators or inhibitors. The genomic contigs generated by mechanically shearing the bacterial DNA. The ccontigs generated by mechanically shearing the bacterial DNA. The predicted coding regions defined by computer evaluation. To identify compounds predicted from various ORF were analysed for sequences predicted from various ORF were analysed for significant compounds the sequences of interest, particular regions can be production, e.g. in E. coli hosts.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SS

CC W09433 shows a human placenta-derived purinergic P-2u receptor community. An assay for up-regulated expression of PNR can accelerate diagnosis and proper treatment of conditions caused by abnormal signal CC dransduction due to systemic and local infections, traumatic and cother tissue damage, hereditary or environmental diseases associated cor pathological problems.

PI Inactive precursor of maize ribosome-inactivating protein - also chimeric ribosome-inactivating protein precursors containing

PT Inactive precursor of maize ribosome-inactivating protein of the chimeric ribosome-inactivating protein precursors containing

PT Inactive precursor of maize ribosome-inactivating protein precursors containing

PT Inactive precursor of maize ribosome-inactivating protein precursor sequence inactivating containing in the construction of the protein sequence in mactivating enterpolic ribosomes, but can be converted by removable, contrivating eukaryotic ribosomes, but can be converted by removal containing enterpolic protein synthesis. They possess a highly contained the sequence is a fighly contained the sequence in the construction of cells, e.g. cancer cells and HTV-infected T contains proliferation of cells, e.g. cancer cells and HTV-infected T cells. The inactive proRIP proteins make it possible to provide protein cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         pri Inactive precursor of maize ribosome-inactivating protein - also prichimeric ribosome-inactivating protein precursors containing internal linker sequences
PT internal linker sequences
PS Claim 2; Column 117-118; 121pp; English.

CC The sequences given in W21698-710 represent Ribosome Inactivating CC Proteins (RIP's), which may be used in the construction of the protein for the invention. The proRIP has a selectively removable, in a converted by removal contractivating eukaryotic ribosomes, but can be converted by removal CC inactivating eukaryotic ribosomes. RIPs are potent contractivating eukaryotic ribosomes. RIPs are potent inhibitors of eukaryotic protein synthesis. RIPs are potent contractic of eukaryotic protein synthesis. RIPs are potent contractic n-q1ycosidase activity which cleaves the glycosidic bond of calenine 4324 of rat liver ribosomal 28S RNA. RIP's selectively inhibit contractivation of cells, e.g. cancer cells and HIV-infected T contraction of cells, e.g. cancer cells and HIV-infected T contraction in the synthesis inhibitors with uses in practical and improved ways not before soyible. The RIP can be used to make cytotoxic conjugates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            rat; r

PT Method for prodn. of cDNA libraries with anchored ends - useful for subtractive cloning of sequences of interest

PS Subtractive cloning of sequences of interest

CC This protein is the longest putative open reading frame encoded by cDNA clone was identified from a full-

CC clone G-4-5 which was activated upon Fusarium moniliforme infection of close sized point cDNA clone was identified from a full-

CC designated ICEFAL (isolation of cDNA ends from an anchored library). The close sized pCR products which do not necessarily require further subcloning/

CC method of generating a cDNA library with anchored ends using a method of isolation of companies of produces discrept companies as opposed to specific cDNA clones as produced by cDNA clone was identified from a nanchored library). The companies of the produces of the produces discrept companies as opposed to specific cDNA clones as produced by cDNA clones as produced by cDNA clones full-length cDNA sobtainable from companies as opposed to specific cDNA clones, as produced by cDNA clones full-length cDNA sobtainable from companies as opposed to specific cDNA clones, as produced by cDNA clones as pCR and RACE require accompanies and companies as pcroduced by cDNA clones full-length cDNA as pcroduced by cDNA clones full-length cDNA sobtainable from companies as opposed to specific cDNA clones, as produced by cDNA clones as pcroduced by cDNA clones and RACE require as pcroduced by cDNA clones as pcroduced by cDNA clones as p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           သည်

IIAA_SEQUENCE 1.0

ID W13647 standard; peptide; 30 AA.

AC W13647;

DT 25-NOV-1997 (first entry)

DE Invariant Chain region which contains the CLIP sequence.

KW Class II associated invariant chain peptide; CLIP region; MHC;

KW major histocompatibility complex; T cell epitope; antigen processing;

KW multiple sclerosis; insulin-dependent disorder; rheumatoid arthritis;

KW myasthenia gravis; allergy; tumour; virus; parasite; mycobacterium;

infection; transplant rejection; immunostimulant; diagnosis.

pr tool - based on primary sequence of invariant chain contg. primary prequence of specific T-cell epitope
ps Disclosure; Page 8; 29pp; German.
CC This is the sequence of amino acids 97-126 from the p35 isoform of the invariant chain (i.e. of a polypeptide which associates with cc major histocompatibility complex class II molecules in the ce endoplasmic reticulum to form a class II molecules in the cc endoplasmic reticulum to form a class II loading compartment).
CC Claimed polypeptides are derived from the invariant chain by cc replacing at least part of the CLIF (CLass II associated Invariant Cc chain peptide) sequence with a T cell epitope. The recombinant cc polypeptide is processed in antigen presenting cells to produce the specific T cell epitope. Such polypeptides are useful in vaccines cc for the treatment of autoimmune disorders, e.g. rheumatoid arthritis, cc multiple sclerosis, insulin-dependent diabetes mellitus and myasthenia cc gravis, allergies and tumours, for the control of viral, parasitic and cc mycobacterial infections, and for use against transplant rejections. CC They can also be used in the diagnosis of autoimmune disorders.
CC Vaccines produced using the recombinant polypeptides have a higher cc immunostimulant specificity and selectivity over prior art vaccines. Sequence 30 AA;
PT DNA encoding prorribosome inactivating proteins - inactive procedures of ribosome inactivating proteins; can be expressed in procedures of ribosome inactivating protein; can be expressed in procedures of ribosome inactivating protein, RIP) protein call 4; Column 117-120; 186pp; English.

CC W25141 shows a Luffin-A (ribosome inhibitory protein, RIP) protein produced which was engineered to contain a selectively removable internal peptide contain was engineered to contain a selectively removable internal peptide contains requant and beta units of the RIP. When CC enkaryotic ribosomes and hence preventing protein production. Many contains the regard activity and are capable of inactivating contains regard and the capacity and the removable internal linker including contains. The RIPs can be used in the construction of therapeutic coxins targeted to specific cells such as tumour cells via the coxins targeted to specific cells such as tumour cells via the coxins targeted to specific cells such as tumour cells via the coxins targeted to specific cells such as tumour cells interest contains targeted to specific cells, pecause of the capacity to provide correct post-translational processing. However, CC antachment of a targeting polypeptide, e.g. a monoclonal antibody. CC RIPs effectively inhibit protein synthesis in eukaryotic cells resulting contains a contain the cells and the contains the contains are not cytotoxic to contain the contains are not cytotoxic to the capacity cells, they can be recombinantly expressed in such cells and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            W13647 Length: 30

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     02-DEC-1997 (first entry)

Luffin-B (a ribosome inhibitory protein) inactive precursor.

Maize; proRIF; ribosome inactivating protein; alpha; beta subunit;

Internal linker; Barley Translation Inhibitor; Trichosanthin;

Ricin A-chain; Abrin-A A-chain; Saporin; SIT-1; Luffin-B; Dianthin 30;

Ricinus communis agglutinin; Momordin; PAP-S; Luffin-B; Dianthin 30;

therapeutic toxin; tumour cell targeted; protein synthesis inhibitor;

post-translational modification; cancer; neoplasia; HIV: AIDS;

human immunodeficiency virus; acquired immune deficiency syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     201

Alpha-4 integrin mouse MAb 21.6 VH region.

Alpha-4 integrin; humanised antibody; monoclonal antibody 21.6;

asthma; atherosclerosis; AIDS; dementia; diabetes; tumour;

metastasis; inflammatory bowel disease; rheumatoid arthritis;

transplant rejection; graft versus host disease; nephritis;

atopic dermatitis; psoriasis; myocardial ischaemia;

acute leukocyte mediated lung injury; therapy.

```
PT Uses of humanised alpha-4 integrin antibody - for treatment of PT asthma, atherosclerosis, AIDS, dementia, etc.

PT claim 25; Fig 7; 10/pp; English.

CC This polypeptide, designated Ha, comprises the heavy chain variable CC region (VH) of a humanised alpha-4 integrin antibody 21.6. It is CC composed of complementarity determining regions (CDRs) from the VH CC region (see W22410) of mouse alpha-4 integrin monoclonal antibody CC 21.6 and a modified human 21/28 CL framework. It can be expressed in mammalian host cells following PCR amplification and mutagenesis CC of appropriate fragments of mouse and human DNA sequences. The CC humanised 21.6 VH and a humanised 21.6 VL (see W22412) can be used to produce a claimed humanised 21.6 vL (see W22412) can be used CC manufacture of a medicament for treating asthma, atherosclerosis, CC AIDS, dementia, diabetes, inflammatory bowel disease, themustoid CC arthritis, transplant rejection, graft versus host disease, tumour cometastasis, nephrifis, atopic dermatitis, psoriasis, myocardial CC ischaemia, and acute leukocyte mediated lung injury. The antibody comay also be used in the affinity purification of alpha-4 integrin CC for use as a vaccine or an immunogen. It is also useful for generating diotypic antibodies. The humanised antibody has a ccomplement of the human circulation essentially equivalent to that CC of naturally occurring human antibodies.
                                                                                                                                                                                                                                                                                                                                                          W09718838-A1.

Complementarity determining regions (CDRs) of the 21.6 The complementarity and a claimed humanised 21.6 The complementary of a medicament for treating a disease selected from asthma, atherosclerosis, AIDS, dementia, diabetes, inflammatory bowel disease, rheumatoid arthritis, transplant rejection, graft versus host disease, tumour metastasis, nephritis, atopic dermatitis, psoriasis, myocardial arthritis, ransplant rejection, graft versus host disease, tumour metastasis, nephritis, atopic dermatitis, psoriasis, myocardial ischaemia, and acute leukocyte mediated lung injury. The antibody may also be used in the affinity purification of alpha-4 integrin for use as a vaccine or an immunogen. It is also useful for invention have a half-life in the human circulation essentially soccurring human antibodies.

                                                        against infectious agents, including pseudorables

Example 2; Column 45-48; 70pp; English.

This sequence comprises a polypeptide, designated C22R, encoded this sequence comprises a polypeptide, designated C22R, encoded the sequence strand (open reading frame 3) of the HindIII C by the sense strand (open reading frame 3) of the Shows no fragment (see TM4564) of swinapox virus (SPV). C22R shows no caparent homology to known protein sequences. A claimed recombinant vector comprises a heterologous nucleotide sequence inserted into, or replacing, all or a portion of a non-essential SPV gene or nucleic acid sequence of the HindIII C fragment. The vector can be used for the expression of heterologous proteins, both in vivo as a vaccine, and in vitro for production of the selected protein. The heterologous protein is preferably selected protein. The heterologous protein is preferably to short-restricted to swine, the use of modified recombinant SPV as a live vaccine vector eliminates the risk of spreading infection cath the virus to other animal populations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    21-APR-1989; 342212.

HARVAN SOLUTION OF THE SECOND SOLUTION OF THE
PT DNA encoding chloroplast RecA-like protein from Arabidopsis thaliana PT useful for increasing the frequency of homologous chromosomal recombination when lacking the transit peptide sequence Sclaim 2; Columns 7-9; 14pp; English.

CC The present sequence is of a Rec-A like protein from Arabidopsis CC thaliana. The cDNA encoding this protein (793777) was isolated from an Arabidopsis library screened with a Synechococcus recA gene. The cDNA compared to the transit peptide, is missing. In E. coli, and thus the start of the transit peptide, is missing. In E. coli, and many other prokaryotes, the Rec-A protein is essential for homologous cand many other prokaryotes, the Rec-A protein is essential for homologous that the enzyme encoded by the present sequence may also be concerned with DNA repair. The 5' end of the recA gene, i.e. the portion encoding the transit peptide part of the protein that directs the final product that directs completed proteins to enter the nucleus. By introducing the increase the frequency of homologous recombination in the chromosomal sequence 438 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ---AUG-1992; US-938332.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pr RAC protein kinase, or modulator excluding wortmannin and vanadate, protein kinase, or modulator excluding wortmannin and vanadate, protein kinase, or modulator sof surface and screening potential modulators of insulin mediated intracellular signalling using RAC-PK, or fragment claim 8; Page 25; 38pp; English.

Critis polypeptide comprises the putative C-terminal region of a novel RAC protein kinase C-terminal binding protein (CTBP). Its sequence was deduced from a cDNA clone (T67134) isolated from a clone (T67134) isola
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     _SEQUENCE 1.

      W24491
                              claim 1; Page 16; 22pp; English.

This sequence represents a novel amylase inhibitory protein which is composed of two subunits, each having the present sequence. This protein can be prepared by extraction from wheat flour, wheat or wheat gluten. The protein is spherical and has S-S bonds, and has a high inhibitory activity against human alpha-amylase. It has about 5-30 times higher inhibit increases in blood sugar levels, inhibit insulin secretion and inhibit an increase in fatty acid levels, inhibit insulin secretion and feeling of satiety after meals, and easily suppressing appetite. The provention of obesity.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 5; page 17: 22pp; English.

This sequence represents a novel amylase inhibitory protein which is composed of two subunits, each having the present sequence. This protein can be prepared by extraction from wheat flour, wheat or wheat gluten. The protein is spherical and has s.s. bonds, and has a high inhibitory activity against human alpha-amylase. It has a higher inhibitory activity as compared with several known amylase inhibitors. It can also inhibit increases in blood sugar levels, inhibit insulin secretion and feeling of satiety after meals, and easily suppressing appetite. The proteins can be used in the treatment and prevention of diabetes and the provention of obesity.
                                                                                                                                                                                                                                         Claim 5; page 18; 22pp; English.

This sequence represents a novel amylase inhibitory protein which is composed of two subunits, each having the present sequence. This protein can be prepared by extraction from wheat flour, wheat or wheat gluten. The protein is spherical and has 5-5 bonds, and has a high inhibitory activity against human alpha-amylase. It has about a higher inhibitory inhibit increases in blood sugar levels, inhibit inscreases in can also inhibit an increase in fatty acid levels in the blood, thus maintaining if celling of satiety after meals, and easily suppressing appetite. The proteins can be used in the treatment and prevention of diabetes and the prevention of obesity.

The protein comprises the subunit of the wheat amylase inhibitor from wheat - for inhibiting the claim 2; Page 16; 22pp; English.

Claim 2; Page 16; 22pp; English.

Claim 2; Page 16; 22pp; English.

Chis protein comprises the subunit of the wheat amylase inhibition of or comprises the subunit of the wheat amylase inhibiting an accumulation of visceral fat and hence for preventing visceral fat obesity is claimed. It contains an amylase inhibitor of wheat corigin as an active ingredient. The amylase inhibitor is selected from 0.26 Ala, 0.25 Alb (see W29524) and 0.19 Al (see W29525). The 0.26 Ala protein has inhibitory activity of 26,100 U/mg against human pancreatic alpha-amylase. Also claimed is a food additive comprising 0.26 Alb. The amylase inhibitors can inhibit the capture in sulin secretion and reduce the activity of lipogenic enzymes in the viscus.

         Polynucleotide(s) encoding type I ribosome-inactivating proteins which are suitable for use as components of cytotoxic therapeutic agents.

Disclosure; Fig 4; 221pp; English.

R63906 is the type I ribosome-inactivating protein (RIP) 14 fin one of the nine RIPs described in R63903-R63911.

RIPS are key components of cytotoxic therapeutic agents (CTAs), which include gene fusion products and immunoconjugates. CTAs may be used to selectively eliminate any cell type to which a RIP component is targetted, by the specific binding capacity of the second component of the agent. They can used in the treatment of diseases where the elimination of a particular cell type is desired, such as autoimmune disease, cancer and graft-versus-host
                                                                                                                                                                                                                                                                                                                                                                                                                                                        Type I ribosome inactivating protein luffin, RIPs;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              useful to provide protection against Epstein Barr virus Disclosure; Fig 5; 62pp; English.

The patent discloses five new peptides which display substantial homology with the CBFI/RBDJK interaction domain of EBNA2 (see M24280-W24284). In particular, the peptides include amino acids 318-327 of EBNA2 (i.e. conserved region 6, or CR6). The peptides, when administered in an amount sufficient to inhibit interaction of EBV EBNA2 with CBFI, are used to protect mammals prior to or following a transplant, against Epstein Barr virus. Labelled peptides are used to detect factors that interact with EBV EBNA2. The present sequence is from one strain of EB virus (human type B used to identify CR6 (GPPWMPPV) residues 69-76).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                W09730081-A1.

PT Streptomyces frenolicin yells (specially actions) actili protein. CC This is a ketoreductase related to the actinorhodin actili protein. CC It is the encoded product of gene P of a claimed Streptomyces claimed coding sequences (genes A-U) that respectively encode 21 CC proteins (see W34199-219) involved in frenolicin synthesis. The 21 CC genes of the cluster can be divided into 5 subclusters: (1) genes CC A, B, C, D and F encode an efflux pump; (2) genes H, I, J and K CC polyketide synthases; (4) genes (9) of and R encode a hemiketalase, CC polyketide synthases; (4) genes (9) of and R encode a hemiketalase, CC encode a keto/encyl reductase and hydrolase. Also claimed are created a keto/encyl reductase and a hydrolase. Also claimed are Streptomyces roseofulvus). Host cells can be cultured to produce the colls (especially a Streptomyces can be cultured to produce the colls (especially a Streptomyces can be cultured to produce the colls (especially a Streptomyces can be cultured to produce the colls (especially a Streptomyces can be cultured to produce the colls (especially a Streptomyces can be cultured to produce the colls (especially especially

SCR proteins (see W38178-201) from dicots and monocots, SCR proteins lacking 1-4 of MOTIFF I-VI, and polypeptides corresponding to MOTIF I, II, III, IV, vor VI of SCR are claimed. Transgenic plants can be insineered to overexpress the SCR protein, so that cell division is increased in roots, resulting in thicker root development, while a plant with an altered stem or hypocotyl gravitropism is less susceptible to lodging. Plants that contain an antisense molecule that suppresses the expression of endogenous SCR gene product have thinner root development. A gene of interest plant to confer herbicide, salt, pathogen or insect resistance, or the second of the second of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   WPI; 97-538619

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          SRPg1 (see T95765). It shows homology to Arabidopsis SCARECROW (SCR) protein (see W88178). SCR is a member of a novel protein family and contains a number of potential functional domains similar to those found in transcription factors. SCR is expressed specifically in embryo root progenitor tissue and in certain root and stem tissues. It regulates as specific asymmetric division, and controls gravitropic response in marrial asymmetric division, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               101
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      cell division and therefore alter root development, or altestem or hypocotyl gravitropism claim 2; Page 136; 221pp; English.
This is the deduced amino acid sequence of soybean genomic SRPg1 (see 195765). It shows homology to Arabidopsis SCARE (SCR) protein (see W38178). SCR is a member of a novel pro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Streptomyces sp.

Protein contg. non-A non-B hepatitis antigen fragment - prepd. by culturing transformants transformed by vector contg. base sequence coding specified aminoacid sequences, used for detecting hepatitis claim 1; Fig 13; 53pp; Japanese.

The present sequence is a non-A non-B hepatitis virus (NANBH) or hepatitis C virus (HCV) antigen, useful for diagnosis or detection. Sequence 239 AA;
                                                                                                           14 - J;

                                                                                                                                                                                                                                                                                                                                                                 Treating papilloma virus infections, by repressing E6 and E7 oncogenic proteins - using E2 polypeptide or nucleic acid encoding it, useful for treating warts and cervical cancer claim 22; Pages 51-53; 71pp; English.

The present sequence is the human papillomavirus-18 (HPV-18) E2 protein.
                                                                                                                                                                                                                              protein, comprising a DNA-binding and transcription activating domain, or the gene encoding the E2 protein to infected cells. The method is applicable to ilvestock, zoo animals, pets and humans, specifically for the treatment, prevention or reversal of warts, e.g. plantar, common, Butcher's common, flat or genital warts, or epidermodysplasia verruciformis, or growth of papillomavirus transformed cells, especially laryngeal papilloma or cervical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         151
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          101
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 1; Columns 27-30; 17pp; English.

The present sequence was used in the development of a novel method for the production of human respiratory syncytial virus (HRSV) glycoprotein F (gpF) or glycoprotein G (gpG). The method comprises culturing eukaryotic host cells transfected with an isolated DNA sequence encoding HRSV gpF or gpG. The gp can be used to prepare vaccines against HRSV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         II-JUN-1998 (first entry)

PT Helicobacter pylori nucleic acid sequences and encoded PT Helicobacter pylori nyesful in vaccines to treat or prevent H. pylori infection and for diagnosis of H. pylori infection PT infection and for diagnosis of H. pylori infection PT infection and for diagnosis of H. pylori infection PT infection and for diagnosis of H. pylori infection or to identify PT PT infection or to identify H. pylori CC Infis sequence is a H. pylori cell envelope outer membrane protein (OMP) CC having a C-terminal tyrosine cluster motif The protein may be used in a cycline to prevent or treat H. pylori infection or to identify H. pylori pylopeptide binding compounds, useful as potential H. pylori life Cycle activators or inhibitors. The DNA and probes derived from it may be compounded to the pylori in a sample and the diagnosis confidence of H. pylori infection. Nucleic acid sequences complementary to the DNA ct as antisense sequences and can be used to prevent the translation of the pylori mRNA. Antibodies against the protein can be used in immunoassays to evaluate the abundance and distribution of CC (ATCC 55679) was determined from overlapping contils generated by CC mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions confidence development, the amino acid sequences predicted coding regions for vaccine development, the amino acid sequences predicted from various ORF were analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (ASTR ) ASTRA AB.

Bacteriophage phi-CPG1 genomic DNA - is useful for transforming mammalian Chlamydia strains
Claim 12: Columns 23-24: 28pp; English.
The present sequence represents the product of the second open reading frame of a circular bacteriophage, designated phi-CPG1. This bacteriophage is able transfect Chlamydia psittact strain Guinea pig Inclusion Conjunctivitis (GPIC). Phi-CPG1 was identified by homology to a previously characterised Chlamydia bacteriophage of avian C. psittaci named Chp1. Chlamydia strains can be responsible for blindness through occular chronic disease trachoma. Phi-CPG1 can be used as a cloning vector, especially as a means to transfer mutant or foreign genes into Chlamydia. Phi-CPG1 can also be used to develop Chlamydia vaccines,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               14-JUL-1998 (first entry)
Open reading frame 2 peptide of bacteriophage phi-CPG1.

The present sequence represents a protein from the frenolicin gene cluster from Streptomyces roseofulvus. The present invention describes: (1) a vector containing the frenolicin gene cluster DNA sequence operably connected to an expression control sequence; (2) a host cell transformed by the above vector; (3) a protein coded by the above DNA sequence; (4) a method for the preparation of frenolicin or a present of the above cell is cultured and frenolicin or its biosynthetic intermediate for it in which the above cell is cultured and frenolicin or its biosynthetic intermediate is isolated from the culture or the cell; (5) a method for the preparation of frenolicin B by oxidising frenolicin, and (6) a method for the preparation of a frenolicin by mixing frenolicin with other components.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                201
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 151
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               101
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  251

Anino acid sequence of phospho-beta-glucosidase (bglA).
Anino acid sequence of phospho-beta-glucosidase (bglA).
Staphylococcus aureus protein; ribozyme; antisense sequence; contro.
Staphylococcal gene; regulatory element; bacterial gene expression; vaccine; Staphylococcal infection; food poisoning; scaled skin synd toxic shock syndrome.

PT DNA encoding human carbonyl reductase polypeptide - useful for recombinant production of the enzyme and anti:sense treatment of PT diseases associated with the enzyme and increase protein CC (INCA) sequence. Also claimed are: a probe that hybridises to the DNA (INCR) sequence. Also claimed are: a probe that hybridises to the DNA (INCR) sequence; an expression vector containing the bukh sequence; and a host CC sequence; an expression vector containing the production of CC carbonyls to alcohols, physiologically functioning as dehydrogenases of CC crasting and nor hydroxysteroids, as well as in drug metabolism. The cell CC can be used to produce a recombinant human carbonyl reductase protein, CC which can be used to treat inflammatory or immunological disorders CC development after exposure to carcingens. The vector can be used for the CC same purpose. The probe can be used to detect carbonyl reductase nucleic crasting from purpose and be used to detect carbonyl reductase nucleic present sequence represents human liver carbonyl reductase nucleic crasting from the used to control expression of the gene. The CC sequence represents human liver carbonyl reductase.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         W56137

The control compounds, and in vaccines against S. Claim 6; Pages 433-434; 989pp; English.

CC The present sequence represents a Staphylococcus aureus protein, that, based on homology with a Bacillus subtilis protein, is believed to be a seed on homology with a Bacillus subtilis protein, is believed to be a phospho-beta-glucosidase (bglA). The DNA sequence was isolated from a library of clones of S. aureus WCH 29 in Escherichia coli. The DNA sequence can be used in the construction of ribozymes and antisense sequences to control the expression of Staphylococcal genes. The DNA sequences to control the expression of Staphylococcal genes. The DNA control of bacterial gene expression. The produce protein may be used to produce vaccines to enable a host to produce specific antibodies with antibacterial action. These vaccines and antibodies would protect a host against invasion by S. aureus, and conditions relating to skin syndrome, and toxic shock syndrome.

Its amino acid sequence was cell-extracellular matrix signalling. Its amino acid sequence was cellced from a clone (see v91914) obtained from a human pancreas c W37816) and hSARP2 (see W37817) proteins are also claimed. hSARP3 c was researched from recombinantly in pancreas. SARP polypeptides can be used in immunoassays for detecting levels of cexpression of SARP, particularly for diagnosis or monitoring of cexpression of SARP, particularly for diagnosis or monitoring of diseases associated with SARP expression. Specifically they are classed to detect cancer of the prostate or breast (by detecting can be used to treat these cancers, or more generally can also be used to treat these cancers, or more generally apports are injury), also (not claimed) to prevent apoptosis in cultured cells, to improve preservation of organs for transplantation, for in situ preservation sare operations and to treat dermatological cotentially useful therapeutically, that modulate the effects of SARP on Wnt-frizzled protein interaction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                W37816
Bacterial growth inhibiting peptide(s) enterocin 900 or brochocin used to inhibit growth of susceptible bacteria in e.g. foodstuff ilving animal, food preparation area or fermentation vessel Example 7; Page 138-139; 174pp; English.

This polypeptide comprises the enterocin-900 pre-protein of Enterococcus faecium 900. Enterocin-900 is a novel broad spectrum bacteriocin that has activity against other strains of Enterococcus as well as many other organisms. The invention includes a method for inhibiting pathogenic bacteria by providing a bacteriocin selected from enterocin-900 and brochocin-C (see W59021), either as a composition or by providing a bacterial source of the bacteriocins. This is used to inhibit spoilage
                                                                                                                                                                                                                  W09809639-A1.

Claim 5; Page 53-54; 139pp; English.

This polypeptide is the deduced product of a DNA sequence (see v2725) amplified from sunflower cv. zebulon genomic DNA using PCR primers (see v27249-50) based on tryptic peptides (see w55050-51) of the isolated sunflower w53 antifungal protein.

R Southern blot of sunflower genomic DNA using this DNA fragment revealed the existence of multiple homologous sequences in the sunflower genome. A full-length clone (see v27260) for sunflower sunflower genome. A full-length clone (see v27260) for sunflower m559 (see w55053) was subsequently obtained. Claimed antifungal proteins, which may include this M559 polypeptide sequence, have a mol.wt. of 55-65 kDa (SDS-PAGE), have carbohydrate oxidase (especially glucose oxidase) activity, show anti-Phytophthora and/or anti-Pythium activity, can be expressed in transgenic plants to reduce susceptibility to infection by fungi, or expressed in host cells for use in antifungal compositions. Plants treatments with fungicides and have a longer shelf life.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       04-SEP-1997; E04923.

The present sequence, designated pfSp114-137, represents Ctenocephalides felis serine protease inhibitor (Sp1) variable domain protein. The Sp1 protein represents a novel target for anti-haematophagous ectoparailtic vaccines and drugs. Compositions containing the inhibitor are used to control fleas (adults or larvae) on mammals or birds, particularly cats and dogs. More generally the composition is also used for control of insects and acarina, on animals or on stored goods, plants, trees etc. including domestic pests and insects that are vectors of disease. The Sp1 proteins are able to induce a protective immune response against Sp1. Sequence 137 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Jucose oxidase; transgenic plant; Phytophthora; Pythium; crop protection; disease resistance.
